A,Status: preliminary
A,Molecule type: mRNA
A,Residues: 33-292 <PAM>
A,Cross-references: EMBL:X53521; NID:g1495, PIDN:CAA37597.1; PID:g3980170
C,Comment: Tissue factor is an integral membrane glycoprotein that serves as a receptor
C;Comment: Expression of tissue factor can be induced in a variety of tissues by certain
C;Superfamily: tissue factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vibliance factor precursor - rabbit

NyAlternate names: coagulation factor III

Cispecias: Orycologus cuniculus (domestic rabbit)

Cispecias: Orycologus cuniculus (domestic rabbit)

10 receptor.";

J. Exp. Med. 197:571-578 (1998).

-1- FUNCTION: RECEPTOR FOR IL-10 AND IL-22. SERVES AS AN ACCESSORY

CHAIN ESSENTIAL FOR THE ACTIVE IL-10 RECEPTOR COMPLEX AND TO

INTIALE IL-10-INDUCED SIGNAL TRANSDUCTION EVENTS.

-1- SUBCELLULAR LOCATION: Type I membrane protein.

-1- SUMLIARITY: Concains 2 fibronectin type III domains.

-1- SIMILARITY: BELONGS TO THE CLASS II CYTOKINE FAMILY OF RECEPTORS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MEDLINE=20469498; PubMed=10875937; Xie M.-H., Aggarwal S., Ho W.-H., Foster J., Zhang Z., Stinson J., Xie M.-H., Aggarwal S., Ho W.-H., Foster J., Zhang Z., Stinson J., Wood W. T., Goddard A.D., Gurney A.L.; Britchlekin (IL)-22, a novel human cytokine that signals through the interferon receptor-related proteins CRF2-4 and IL-22R."; J. Biol. Chem. 275:31335-3139(2000).

-I. FUNCTION: RECEPTOR FOR IL-10 AND IL-22. SERVES AS AN ACCESSORY CHAIN ESSENTIAL FOR THE ACTIVE IL-10 RECEPTOR COMPLEX AND TO INTIATE IL-10-INDUCED SIGNAL TRANSDUCTION EVENTS.

-I. SUBCELLULAR LOCATION: Type I membrane protein.

-I. SIMILARITY: Contains 2 fibronectin type III domains.

-I. SIMILARITY: BELONGS TO THE CLASS II CYTOKINE FAMILY OF RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pestka S.; "Identification and functional characterization of a second chain of

"Cloning of guinea pig tissue factor cDNA: comparison of primary
structure among six mammalian species.";

Thromb. Haemost. 83:455-461(2000).

-!- FUNCTION: INITIATES BLOOD COAGULATION BY FORMING A COMPLEX WITH
CIRCULATING PACTOR VII OR VIIA. THE [TP:VIIA] COMPLEX ACTIVATES
FATORS IX OR X BY SPECIFIC LIMITED PROTOLYSIS. TF PLAYS A ROLE IN
NORMAL HEMOSTASIS BY INITIATING THE CELL-SURFACE ASSEMBLY AND
PROPAGATION OF THE COAGULATION PROTEASE CASCADE.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- SIMILARITY: BELONGS TO THE TISSUE FACTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             21 LIGWVLVQVAGAEGI--PVKPYNLTWKSTNFKTILEWEPKPI----NNVYTVQ----IST

Interferon-alpha/beta receptor alpha chain precursor (IFN-alpha-REC).
IFNARI OR IFNAR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- TISSUB SPECIFICITY: IFN RECEPTORS ARE PRESENT IN ALL TISSUES AND EVEN ON THE SURPACE OF MOST IFN-RESISTANT CELLS.
-!- FURN ON THE SURPACE OF MOST IN-RESISTANT CELLS.
-!- PITM: PHOSPHORYLATED ON TYROSINE REDUGS BY TYKZ TROSINE KINASE.
-!- SIMILARITY: CONTAINS 2 fibronectin type III domains.
-!- SIMILARITY: BELONGS TO THE CLASS II CYTOKINE FAMILY OF RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MEDLINE-92129376; PubMed-1370833;

-!- FUNCTION: RECEPTOR FOR INTERFERONS ALPHA AND BETA. BINDING TO TYF
-!- FUNCTION: RECEPTOR FOR INTERFERONS ALPHA AND STALGERS TYROSINE PHOSPHORYLATION OF A NUMBER OF PROTEINS INCLUDING JAKS, TYKZ, STAT PROTEINS AND IFN-R ALPHA-AND BETA-SUBUNITS THEMSELVES.
                                                                                                                                                                                                                                                                         -!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- TISSUB SPECIFICITY: EXPRESSED IN ALL TISSUES EXAMINED EXCEPT
CONCEPTUS AT DAY 15 OF PREGNANCY.
-!- SIMILARITY: CONTAINS 2 fibronectin type III domains.
-!- SIMILARITY: BELONGS TO THE CLASS II CYTOKINE PAMILY OF RECEPTORS.
TISSUE=Endometrium;

"Behavior of a cloned murine interferon alpha/beta receptor expressed
in homospecific or heterospecific background.";
Proc. Natl. Acad. Sci. U.S.A. 89:4774-4778 (1992)
- FUNCTION: RECEPTOR FOR INTERFERONS ALPHA AND BETA. BINDING TO TYPE
I IFNS TRIGGERS TYROSINE PHOSPHORYLATION OF A NUMBER OF PROTEINS
INCLUDING JAKS, TYRZ, STAT PROTEINS AND IFN-R ALPHA-AND BETA-
                                                                                                                                                                                           01-FEB-1994 (Rel. 28, Created)
01-FEB-1994 (Rel. 28, Last sequence update)
28-FEB-2003 (Rel. 41, Last annotation update)
Interferon-alpha/beta receptor alpha chain precursor (IFN-alpha-REC)
IFNARI OR IFNAR OR IFAR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SUBCELLULAR LOCATION: Type I membrane protein.
SIMILARITY: Contains 2 fibronectin type III domains.
SIMILARITY: BELONGS TO THE CLASS II CYTOKINE FAMILY OF RECEPTORS.
                                                                                                                                                                                                                                                                                           Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

Mol. Cell. Biol. 9:2567-2573(1989).

-! FUNCTION: INTIATES BLOOD COAGULATION BY FORMING A COMPLEX WITH

CIRCULATING FACTOR VII OR VIIA. THE [TF:VIIA] COMPLEX ACTIVATES

FACTORS IX OR X BY SPECIFIC LIMITED PROTOLYSIS. TF PLAYS A ROLE IN NORWAL HEMOSTASIS BY INITIATING THE CELL-SURFACE ASSEMBLY AND PROPAGATION PROTEASE CASCADE.

-! SUBCELLULAR LOCATION: Type I membrane protein.

-! SINILARITY: BELONGS TO THE TISSUE FACTOR FAMILY.

SUBURILAR LOCATION: Type I membrane protein.

PIW: PHOSPHORYLATED AT SER/THR RESIDUES.

SIMILARITY: Contains 2 immunoglobulin-like C2-type domains.

SIMILARITY: Contains 2 fibronectin type III domains.

SIMILARITY: BELONGS TO THE CLASS II CYTOKINE FAMILY OF RECEPTORS.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Description

```

```
The invention relates to an isolated type 2 cytokine receptor family (CRF2-12) nucleic acid molecule encoding a polypeptide with amino acids 21-66 of a 231 residue amino acid sequence, given in the specification, or its complement. The compositions and methods of the present invention are useful for diagnosing, screening and treating disorders associated with abnormal CRF2-12 activity such as autoimmune diseases like rheumatoid archritis, multiple sclerosis and inflammation. This sequence represents a cytokine receptor family 2 (CRF2-12) protein relating to the
                                                                                                                                    Immunosuppressive, antirheumatic, antiarthritic, neuroprotective; antiinflammatory, interleukin-antagonist-22, gene therapy, interferon-antagonist-alpha; interferon-antagonist-beta; interferon-antagonist-clammatory, cytokine receptor family 2; CRF2-12; autoimmune disease; rheumatoid arthritis; multiple sclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, cytokine receptor; immune disease; psoriasis; cancer; infection; rheumatoid arthritis; multiple sclerosis; Crohn's disease; ulcerative colitis; transplant rejection; abortion; antipsoriatic; immunosuppressive; antirheumatic; antiarthritic; neuroprotective; antiinflammatory; antiulcer; cytostatic; dermatological;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated CRF2-12 nucleic acid encoding a polypeptide, useful for diagnosing and treating disorders with abnormal CRF2-12 activity such as autoimmune diseases like rheumatoid arthritis, multiple sclerosis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to the isolation of 9 novel human PRO polypeptides and the CDNA sequences (AAS15360-AAS15368) encoding them. The provel PRO polypeptides include PRO1356, PRO1368, PRO1368, PRO1364, PRO3444, PRO3151, PRO4322, PRO9964, PRO1006 PRO1359. PRO1569, PRO1364, PRO3151, PRO4322, PRO9964, PRO1006 PRO19598. The CDNA sequences encoding these PRO polypeptides have been designated as clones DNA64886-1601, DNA64903-1553, DNA84318-2520, DNA95997, DNA89273, DNA89273, DNA9223-2567, DNA96903-1553, DNA101921 and DNA145887 respectively.

Compositions (e.g. vaccines) containing PRO polypeptides and methods of using these compositions are useful in the treatment and diagnosis of imflammatory disorders (e.g. otdeoarthritis), infimume-mediated inflammatory disorders (e.g. otabates mellitus), infectious disorders (e.g. diabates mellitus), infectious disorders (e.g. theumatoid arthritis), immune-related renal diseases (e.g. cirrhosis), demyelinating diseases of the peripheral or central nervous system (e.g. diallalan-Barre syndrome), immune-mediated cases contact dermatitis), neoplasias and transplantation associated diseases. The invention relates to secreted and membrane-associated polypeptides and polymucleotides. The sequences of the invention are useful in diagnostic assays for detecting diseases associated with inappropriate activity or levels of these polymucleotides, and in identifying their activity or levels of these polymucleotides, and in identifying their agonists and antagonists that are potentially useful in therapy. The sequences of the invention are useful as vaccines for inducing timention are useful as vaccines for inducing timention are useful as vaccines, heematopoietic disporders, infections, autoimmune disorders, heematopoietic disporders, nound healing disorders, cholesteryl ester storage disease, infections, altherimer's disease, multiple sclerosis, inflammation, congenital muscular dystrophy, junctional epidermolysis (viral and bacterial infections, Alzheimer's disease, asthma, arthritis, allergies, schizophrania, spg44224PRROa-associated disorders, consistential and bacterial infections, Alzheimer's disease, transplant rejection, congenital infections, Alzheimer's disease, transplant rejection, allergies, schizophrania, spg44224PRROa-associated disorders, conference including parasupranuclear palsy, myotonic dystrophy, depretension, anxiety disorders and aleep disorders are prisorders including parasupranuclear palsy, myotonic dystrophy, disorders including chronic obstructive pulmonary disease including chronic obstructive pulmonary disease including chronic obstructive pulmonary disease including chronic construction and adult respiratory distress syndrome, including and adult respiratory diseases syndrome, including acute and chronic creal failure, glomerulonome, cystinuria, skeletal muscle disorders including parte and chronic creal failure, glomerulonome, cystinuria, skeletal muscle disorders including parte and chronic creal failure, glomerulonome, cystinuria, skeletal muscle disorders including parte and chronic renal failure, glomerulonome, cystinuria, skeletal muscle disorders including parte and c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel secreted and membrane-associated polypeptides and polynucleotides useful for preventing, ameliorating or correcting dysfunction or disease including diabetes, cancer, hypertension and growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score 188; DB 23;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides the protein and coding sequences of 3 diagnosis, of a human cytokine receptor. The sequences can be used in the diagnosis, prevention and treatment of immune diseases, including psoriasis, cancer, chronic/life-threatening infections, rheumatoid arthritis, multiple sclerosis, Crohn's disease, ulcerative colitis and transplant rejection and in reproductive medicine, e.g. for diagnosing abnormal immune reactions which cause abortions. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Human novel secreted protein, Seg ID 1340.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a new polymucleotide that encodes a soluble protein which binds to interleukin (IL)-TIF/IL-22 (also referred to as IL-22BP), where the complementary sequence of the invention by bridises under stringent conditions to a nucleotide sequence of 2271 or 2366 base pairs, as given in the specification. The molecules of the invention are useful for inhibiting (antagonising) effect of IL-TIF/IL-22 on a cell, for determining whether IL-TIF/IL-22 is present in a sample, for inhibiting binding of IL-TIF/IL-22 to a binding partner, preferably in vitro, and for obtaining an antibody molecule specific for the soluble binding protein of the invention, from a population or panel of antibody molecules of diverse binding specificity. The soluble protein is further useful in manufacture of a medicament for treating an IL-22 mediated is useful in manufacture of a medicament for treating an IL-22 mediated fragment of IL-TIF/IL-22 or the soluble protein, that modulates binding of the soluble protein to IL-TIF/IL-22, where the agent identified is useful the manufacture of medicament for treating IL-TIF/IL-22 mediated disorder. The antibody is determining presence of the soluble protein, where the antibody is determining presence of the soluble protein, where the antibody is determining presence of the soluble protein, where the antibody is determining presence of the soluble protein, where the antibody is determining presence of the soluble protein, where the antibody is determining presence of the soluble protein, where the antibody is determining presence of the soluble protein, where the antibody is determining presence of the soluble protein was a light of the soluble protein, where the antibody is determining presence of the soluble protein was a light of the soluble protein, where the antibody is determining presence of the soluble protein was a light of the

```
The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunosorbant assays (ELISA). Disorders which are diagnosed or treated include autofimmune diseases e.g. rheumarcid arthritis, hyperproliferative disorders e.g. rheumarcid arthritis, chyperproliferative disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, orberovascular disorders e.g. corneal infection, and many other disorders e.g. corneal infection, and many other disorders e.g. corneal infection, and many other disorders listed in the specification. The polypeptides can also be used to and wound healing and epithelial cell proliferation, to prevent skin aging due to sumburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypetides can also case a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The present
                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid molecules encoding 461 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or preservatives -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sequence represents a novel secreted protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 11; SEQ ID No 1340; 980pp; English

```
The invention relates to human novel polypeptides and their associated polymucleotides. The polypeptides and polymucleotides are useful in gene therapy for treating, inhibiting or preventing neural disorders, immune system disorders (e.g. systemic lupus erythematosus, rheumatoid arthritis and multiple sclerosis), muscular disorders, respiratory diseases (e.g. nasal vestibulitis, nasal polyps and sinusitis), reproductive disorders (e.g. congenital heart defects, Ebstein's anomaly and hypoplastic left heart syndrome), renal disorders (e.g. congenital heart defects, Ebstein's anomaly and hypoplastic left heart syndrome), renal disorders (e.g. acute kidney failure and end eatage renal disease), hypoproliferative disorders (e.g. Hodgkin's disease and leukaemia), inflammatory diseases (e.g. conditions (e.g. asthma), blood related disorders (e.g. thrombosis, atherosclerosis and myocardial infarction) and cancerous diseases. Sequences ABUS4914+ABUS5699 and ABUS5748 represent human novel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; immunosuppressive; antiarthritic; antirheumatic; cytostatic; cardiant; vasotropic; cerebroprotective; nootropic; cerebroprotective; nootropic; ucurogrotective; antibacterial; virucide; fungicide; opthalmalogical; vulnerary; secreted protein; rheumatoid arthritis; hyperproliferative disorder; cardiovascular disorder; cardiovascular disorder; cerebral ischaemia; anglogenesis; nervous system disorder; Alzheimer; sidesase; infection; ocular disorder; corneal infection; wound healing; epithelial cell proliferation; skin ageing; food additive; preservative; antiproliferative.

New nucleic acid molecules encoding 461 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or preservatives -

Claim 11; SEQ ID No 891; 980pp; English.

The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked

```
immunosorbant assays (ELISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. neoplasms of the breast or liver, ardiovascular disorders e.g. orthogonesis, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungicand ocular disorders e.g. corneal infection, and many other disorders listed in the specification. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintenian organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as food additive or preservative to increase or decrease storage as a food additive or preservative to increase or decrease storage as food additive on the invitation, capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                muscular disorder; respiratory disease; reproductive disorder; gastrointestinal disorder; pulmonary disorder; cardiovascular disorder; phyperproliferative disorder; inflammatory disease; allergic reaction; blood related disorder; cancer; immunosuppressive; antiinflammatory; cardiovascular; nephrotropic; cytostatic; antiallergic; thrombolytic;

The invention relates to human novel polypeptides and their associated polymucleotides. The polypeptides and polymucleotides are useful in gene therapy for treating, inhibiting or preventing neural disorders, immune system disorders (e.g. systemic lugus erythematosus, rheumatoid arthritis and multiple sclerosis), muscular disorders, respiratory diseases (e.g. nasal vestibulitis, nasal polype and sinusitis), reproductive disorders (e.g. congenital heart defects, Ebstein's cardiovascular disorders (e.g. congenital heart defects, Ebstein's cardiovascular disorders (e.g. congenital heart syndrome), renal disorders (e.g. kidney failure and end-stage renal disease), hyperproliferative disorders (e.g. Hodgkin's disease and leukaemia), inflammatory diseases (e.g. esptic shock, bursitis and appendicitis), allergic reactions and conditions (e.g. asthma), blood related disorders (e.g. thrombosis, cherosclerosis and myocardial infarction) and cancerous diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polypeptides and nucleic acids, useful in gene therapy for treating, inhibiting or preventing e.g. neural, immune system, muscular, respiratory, reproductive, gastrointestinal, pulmonary, cardiovascular or renal disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   3

Human, nucleic acid-associated protein, NAAP-7; neurological disorder, arteriosclerosis; cancer; cell proliferative disorder; atherosclerosis; lymphoma; epilepsy; Alzheimer's disease; developmental; anticonvulsant; autoimmune disorder; AlDS; allergy; anemia; stroke; malaria; leishmania; gene therapy; nootropic; neuroprotective; cerebroprotective; virucide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to nucleic acid-associated proteins (NAAP) and nucleic acids. The nucleic acid and amino acid sequences are useful for diagnosing, treating and preventing cell proliferative e.g. arteriosclerosis, atherosclerosis, lymphoma or cancers), neurological (e.g. epileppy, Alzheimer's disease or stroke), developmental, and autoimmune disorders (e.g. AIDS, allergies, or anaemia) or infections (e.g. malaria, or leishmania), as well as in assessing the effects of exogenous compound on the expression of nucleic acid-associated proteins. The invention is useful in gene therapy. The present sequence is human NAAP-7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ramkumar J, Yao mc,

The present sequence is encoded by tumour suppressor gene IB3089A, also known as DBCCRI (Deleted in Bladder Cancer Chromosome Region candidate 1). The gene is located at 9432-33. Although the gene is cound in several bladder cancer cells. The DBCCRI gene is involved in the development of sporadic cancer, probably by the deletion of one alled of the gene and/or hypermethylation of the remaining allele, leading to reduced expression of the pene amaining allele, leading to reduced expression of the gene maining allele, are used for treatment or prevention of cancer, particularly bladder, ovarian or skin cancer, squamous carcinoma, renal cell carcinoma or squamous cell oesophageal carcinoma. The DBCCRI protein can be used directly in the same way, or used to raise antibodies and to screen for modulators. The products can be used for diagnosis or cancer, or to indicate predisposition to cancer (including prenatal testing), particularly where this is associated with loss of heterozygosity at 9332-33. Antibodies may also be used for affinity purification, therapeutically as modulator and to detect the protein in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    expressed in multiple tissues but is often down-regulated or silenced in bladder cancer cells due to hypermethylation. The DBCCR1 protein has cytostatic activity. The present sequence and the DBCCR1 promoter can be used in the diagnostic, prophylactic and therapeutic treatment of cancer, especially that which is associated with loss of heterozygosity involving 9q32-33. The cancer includes bladder cancer, squamous carcinoma, skin cancer, renal cell carcinoma, oesophageal and ovarian cancers.

                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is a tumour suppressor protein 183089A, also referred as DBCR1 for Deleted in Bladder Cancer Chromosome Region candidate 1. The protein is obtained from a CDNA whose major portion is derived from a clone (Texps5097K12270) isolated from a gridded human foetal brain cDNA library. The DBCCR1 gene was found to be localised at 9932-33 chromosomal region between D951848 and AFWA239XA9. It is

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by p. acnes. The disorders include SAPHO syndrome (synovitis, acne, p. acnes; proventions and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bono, joints and the central nervous system, however it is particularly involved in the inflammatory resence or absence of P. acnes in a patient comprises contacting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention of polypeptides may be used as antigens in the production of antibodies and therefore treated by antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes prosence, by enzyme linked immunosorbent assay (ELISS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         of the printed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1;
                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which human liver single exon encoded peptides of the invention.

Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Human; foetal liver; gene expression; single exon nucleic acid probe.

WO200157277-A2

09-AUG-2001

Homo sapiens

Peptide #5932 encoded by human foetal liver single exon probe.

The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver -
